Executive Summary

The growing demand from our clients for platforms capable of developing Artificial Intelligence models (LLMs and others), as well as the need for efficient computing power to run these workloads, has led Maxtel to create two new platforms:

Key Features

- Modeling and quantization using dedicated Apple M4 processors: A cost-effective and truly efficient solution that allows our clients to enter the world of AI at accessible price points.

- Virtual machines with dedicated GPU power: Designed to run AI processes with an exceptionally efficient ratio between performance and computing power, built on Nvidia A10G GPUs.

Business Benefits

- Faster AI environment rollout for development and production.

- Balanced cost/performance for training and inference workloads.

- Flexible growth model to scale projects without operational friction.
